**TITLE** Mental Retardation Source Book of the Department of Health, Education, and Welfare.

**INSTITUTION** Department of Health, Education, and Welfare, Washington, D. C. Office of Mental Retardation Coordination.

**PUB DATE** Sep 72

**NOTE** 130p.

**EDRS PRICE** MF-\$0.65 HC-\$6.58

**DESCRIPTORS** \*Clinics; Facilities; Federal Aid; Financial Support; \*Institutions; \*Mentally Handicapped; \*National Programs; Residential Programs; \*Statistical Data

## ABSTRACT

The source book is a compilation of statistical data from all of the mental retardation programs administered by the various agencies of the Department of Health, Education, and Welfare. The first of three major sections, which concerns inpatient statistics from residential institutions, presents such data as number and characteristics of residents and facility licensure requirements. The second section of data deals with outpatient or day care services, presenting information on various types of outpatient clinics and on educational services for retarded children. The third section contains data on four selected Federal programs of which the retarded constitute part of the recipients or beneficiaries: Social Security Administration (SSA) Childhood Disability Allowance program, SSA Worker Disability Allowance program, Rehabilitation Services Administration rehabilitation program, and public assistance programs. (KW)

## INTRODUCTION

The responsibility for coordination of the programs and activities of the Department of Health, Education, and Welfare which affect the mentally retarded rests with the Office of Mental Retardation Coordination. (Before January 26, 1972, this office was known as the Secretary's Committee on Mental Retardation.)

This coordination is probably the most crucial factor in successful administration of the Department's mental retardation programs, because mental retardation cannot be confined to any one health, education, rehabilitation, or welfare program. With an estimated 6 million mentally retarded persons in the United States, and approximately 120,000 mentally retarded infants born each year, a total program must include a wide range of activities designed to confront the problems of mental retardation simultaneously from many points. Therefore, many Departmental agencies administer programs which affect the mentally retarded. It is extremely important that these efforts be focused and targeted so as to prevent duplication and gaps in program services.

For these reasons, a Subcommittee on Statistics was organized under the Office of Mental Retardation Coordination. The responsibility of the Subcommittee is the coordination of mental retardation statistics collected within the Department. This publication represents one of the Subcommittee's first attempts at such coordination. Data from all the Department's major programs which relate to mental retardation have been compiled into one report to serve as a "source book" of the most recent data available. Because these data are from various sources, each having its own definitions, collection methods, and uses for the data, the type of information available in each chapter differs greatly.

While various parts of this report have been published previously, either by the Departmental agency responsible for the data or by the Secretary's Committee, the significance of this report is that it represents the first compilation of mental retardation statistics from virtually every Departmental agency that produces such data. Successive editions will be issued at periodic intervals, as new data become available.

The report is divided into three major sections. The first section deals with inpatient statistics from residential institutions. It also presents data on the number and characteristics of the residents in such facilities, and the licensure requirements for these facilities.

The second section concerns outpatient or day care services available to the mentally retarded. It contains information on various types of outpatient clinics, as well as information on educational services for mentally retarded children.

The last section deals with four Federal programs of which the mentally retarded constitute part of the recipients or beneficiaries. These programs are the Social Security Administration (SSA) Childhood Disability Allowance program, the SSA Worker Disability Allowance program, the Rehabilitation Services Administration program of vocational rehabilitation, and various public assistance programs, such as Aid to the Blind, and Aid to the Permanently and Totally Disabled.

Grateful acknowledgement is offered to the following members of the Subcommittee whose continued assistance and cooperation were largely responsible for the compilation of this report: Mrs. Gloria Hollis and Mr. Sheldon Starr, National Center for Health Statistics, Health Services and Mental Health Administration (HSMHA); Mr. Carl Taube, National Institute of Mental Health, HSMHA; Mr. Stanton Craigie, Maternal and Child Health Services, HSMHA; Mr. Emmett Dye, National Center for Social Statistics, Social and Rehabilitation Service (SRS); Mr. Richard Walker, Division of Developmental Disabilities, SRS; Dr. Lois Elliott, Bureau of Education for the Handicapped, U. S. Office of Education; and Mr. Philip Lerner, Office of Research and Statistics, Social Security Administration.

## PART I

### RESIDENTIAL FACILITIES FOR THE MENTALLY RETARDED

Chapters 1-3 present data on the institutionalized mentally retarded. Institution is used to denote long term care facilities as opposed to short term residential or inpatient facilities such as general hospitals, community mental health centers, community centers for the retarded, and other short term facilities.

Data are presented on three major types of institutions: public institutions for the mentally retarded, private institutions for the mentally retarded, and State mental hospitals. The latter, while their primary focus is on mental illness, contain a considerable population of mentally retarded residents. In 1969, almost 32,000 residents in State mental hospitals were diagnosed with mental retardation as the primary disorder. This represents 12 percent of the total institutionalized retarded. Private institutions for the mentally retarded contained approximately 33,000 residents in 1969, or 13 percent of the total institutionalized resident population. The bulk of the institutionalized mentally retarded were in the public institutions for mental retardation, which contained approximately 190,000 residents or 75 percent of the total. While private mental hospitals might also be classified as institutions, they serve such a small number of mentally retarded residents (only 75 out of a total of 11,000 residents in 1969 had a primary diagnosis of mental retardation) that they are excluded from this discussion.

The data presented on each of these three types of institutions are derived from three different sources. The information on the private institutions for the retarded was derived from the Master Facility Inventory of the National Center for Health Statistics. The data on public institutions for the retarded come from the mental retardation reporting program of the Division of Developmental Disabilities, SRS. The data on the mentally retarded in the State mental hospitals are derived from the national reporting program of the National Institute of Mental Health.

Because these data are from three different sources, the information available on each type of facility is not always the same, nor are the data easily comparable among chapters. All the relevant data from each survey mechanism are presented, however, despite the fact that there may not be corresponding information for the other types of facilities.

## CHAPTER 1

### PRIVATE INSTITUTIONS FOR THE MENTALLY RETARDED

While trend data on the number of private facilities are not available, fairly detailed information on these facilities is available from the 1969 survey of the Master Facility Inventory (MFI) conducted by the National Center for Health Statistics. (The MFI is a listing maintained on computer tape of all inpatient health facilities in the United States. Further information concerning it may be obtained from the National Center for Health Statistics.)

Private institutions for the mentally retarded are characteristically small. On the average they have 47 residents, as opposed to the public institutions which traditionally are large. While the total number of private facilities (708) far exceeds the number of public institutions (180), they constitute a smaller percent of the total institutionalized population because of their much smaller average case load.

Of the 708 homes, 477 (67 percent) were proprietary, i.e., profit-making, homes, and 231 (33 percent) were nonprofit. The proprietary homes, however, were much smaller on the average than the nonprofit homes. They had an average of 25 residents as opposed to 91 residents in nonprofit homes. As a result, the nonprofit homes accounted for 64 percent of the total residents in private homes despite the fact that they accounted for only a third of the facilities (Table 1).

Of these 708 facilities, about 15 percent accepted males only, 18 percent accepted females only, and 66 percent accepted both sexes. Facilities accepting both sexes were on the average larger, with 56 residents per facility. Facilities accepting females only averaged 18 residents per facility as opposed to an average of 39 residents in those facilities serving males only (Table 2).

Of the total facilities, 41 percent will accept patients under 21 years only, 26 percent will accept only patients 21 years and older, and 33 percent accepted all ages. It should be noted that those facilities serving all ages were considerably larger, averaging 76 residents per facility. Those facilities accepting only patients under 21 averaged 34 residents, and those homes accepting only those 21 or older averaged 29 residents (Table 3).

These facilities employed a total of 17,000 persons, 14,000 of these on a full-time basis. Profit-making facilities employed a larger percentage of part-time persons (24 percent) than nonprofit facilities, which employed only 14 percent of their staff part-time. Converting the part-time employees to full-time equivalents by assuming that they are equal to one-half of a full-time employee, it can be seen that profit-making facilities have an average of 2.6 residents per full-time equivalent employee, slightly more than the nonprofit facilities, where there was an

average of 1.9 residents per full-time equivalent employee (Tables 4 and 5).

Information was also obtained in the 1969 MFI Survey on whether these facilities had classes for educable children, trainable children, profoundly retarded children, and adults, and whether they offered vocational rehabilitation, medical rehabilitation, or other programs. Nonprofit facilities were more likely to have these programs than profit-making facilities. Most striking is the percent of facilities which reported having none of these programs: 27 percent of the nonprofit facilities and 37 percent of the proprietary facilities. These facilities presumably are very small and offer only room, board and some personal care services (Table 7).

## CHAPTER 2

### PUBLIC INSTITUTIONS FOR THE MENTALLY RETARDED

Since a national reporting program for public institutions for the mentally retarded has been in operation for many years, trend data are available on these facilities. These data are obtained from the Mental Retardation Reporting Program of the Division of Developmental Disabilities, SRS. (This program was transferred to SRS in 1969 from the National Institute of Mental Health, which had conducted the program since the years following World War II).

The tables in this Chapter show detailed data by State for 1970 (Tables 8-10) and trend data for selected variables for the interval 1960-1970 (Tables 11-20). Definitions and qualifications of the data are given in a section following the Tables.

The number of public institutions has increased 76 percent between 1960 and 1970, from 108 in 1960 to 190 in 1970 (Table 16). Presently, every State except Nevada has at least one public institution for the mentally retarded. New York leads the nation in the number of such institutions with 17, Missouri is second with 12, followed by Texas and Michigan with 10 each, then Pennsylvania and California with nine each (Table 8). Since 1962, more institutions have opened than in the previous two decades.

Table 10 shows that an estimated 117,327 persons were employed full-time in public institutions in 1970. This is more than double the number employed ten years ago. The overwhelming majority of employees are attendants, matrons, and maintenance employees. The ratio of patients to employees has consistently reflected an increase in the number of employees per patient over the years, and in 1970 as in the previous year, there were less than two patients for each full-time employee (Table 19).

The total cost of operating and maintaining these institutions was almost 871 million dollars in 1970 (Table 10). This represents more than a threefold increase over the past decade. (Maintenance expenditures are defined as all expenditures incurred by an institution except construction costs).

Table 10 also indicates that there was a wide range among the States in the cost per day spent for the mentally retarded in 1970. The average was \$11.64 per day, quite low in relation to per patient costs for other types of facilities; quite a bit higher, however, than the \$4.20 per day national cost of 10 years ago (Table 20).

The number of resident patients in institutions gradually increased over the years at an average annual rate of 3.0 percent per year, reaching a high of 193,188 residents in 1967 (Table 11). In 1968, the number of residents began to decrease slightly; this decrease has continued through 1970, when

the number of residents as of June 30 is estimated at 186,743 persons. This decline in the number of residents is also reflected in modest declines in the rate per 100,000 population since 1967 (Table 18).

The number of net live releases, while fluctuating prior to 1966, showed a substantial increase in almost every year since 1965. For the first time in 1969, and again in 1970, the number of net live releases was approximately equal to the number of admissions. In prior years admissions had exceeded net live releases by 20 percent or more (Table 11).

The number of first admissions, while fluctuating between 1961 to 1966, has decreased slowly since 1967 (Table 12). Readmissions have increased since 1967, however, causing the total number of admissions to remain about the same over the period from 1961-1970. Readmissions constituted 19 percent of the total admissions in 1970, as opposed to about 8 percent in 1961. Trends in the number and rate of first admissions by age for the United States can be seen in Table 13.

Table 14 shows the trends in the number and rate of residents by age for the United States. As can be seen from this Table, the main reason for the decline in the overall number of residents is that the percent of residents 20 years of age and older has declined considerably. Since the decreases in the older age groups exceeded numerically the increases in the younger age groups, the net effect has been a slight decrease in the total number of residents.

While the number of deaths annually in public institutions fluctuated from 1961 to 1966, and remained around 3600 for the next three years, it decreased to under 3500 in 1970 (Table 15). The death rate per 1,000 average resident patients has fluctuated around 18 or 19 over this interval.

Starting with 1961, data on Hawaii are included in this reporting system. The institution in Alaska was destroyed by an earthquake in March 1964, causing patients and some employees to be transferred temporarily to another facility. Data for Alaska, therefore, are included in Tables 11 to 20 only for the years 1967 to 1970.

\*Estimated

<sup>1/</sup> Data underestimated as one Institution reported only by number of patients under care and not corresponding maintenance expenditures

SOURCE: "Public Institutions for the Mentally Retarded - Trends in Caseload, Manpower, Expenditures," Social and Rehabilitation Service, DHEW, July 1968 (Updated to 1970)

# FOOTNOTES FOR TABLES 8-10

- 1/ The United States total does not include Nevada since Nevada has no public institutions for the mentally retarded.
- 2/ Alabama: Data reported was for the fiscal year ending September 30, 1970.
- 3/ Arkansas: The Arkansas Children's Colony consists of three residential units located in various geographical settings within the State which are centrally administered and funded. In addition there is a rehabilitation unit with residential capacity for 80 trainees. The expenditure figures do not include costs associated with the rehabilitation unit nor do they reflect any other monies than those from State appropriations.
- 4/ California: In some instances personnel data reflect hospital employees who treat both the mentally retarded and the mentally disordered.
- 5/ Colorado: Expenditure figures include some Federal funds.
- 6/ Connecticut: Of the eight facilities included in their report six are regional centers and two are considered training schools. The latter are large long-term-stay facilities which provide services to nearly 90% of residential patient population.
- 7/ Georgia: The data as presented are aggregate figures for all State-run facilities with residential capacity. Thus the expenditures as reported includes services to day patients, night patients, and inpatients at two retardation centers opened during the year.
- 8/ Illinois: The readmissions figures include 57 transfers from State hospitals and the net release figures include 265 transfers to State Hospitals.
- 9/ Maine: Pineland Hospital and Training Center is a dual purpose facility. Only data pertaining to mentally retarded are reported here.
- 10/ Minnesota: One new center was opened at the end of the fiscal year and another facility was closed. In computing daily maintenance expenditures 465 average daily patients and 645 patients under treatment were excluded since expenditure figures were not available for the facilities providing residential services for these patients.
- 11/ Missouri: Two new facilities that provide inpatient services were opened this year. This increases the number of Regional Diagnostic Centers to nine within the State system in addition to the three State School-Hospital facilities. The daily maintenance expenditures computations are estimated figures for just the three long term stay residential institutions.
- 12/ New York: Data reported was for the fiscal year ending March 31, 1970. Data on personnel and maintenance expenditures excludes Albion State Training School and Beacon State Institution. Maintenance expenditures are also excluded for New York State Research Institute. Therefore, the maintenance expenditure computations and these ratios reflect a slightly lower value than if the data had been excluded.
- 13/ Ohio: Includes data on the mentally retarded patients at the following dual purpose institutions: Cambridge State Hospital and Springview Hospital. Personnel and maintenance expenditures for these two facilities were not included. However, the ap-

proximately 300 mentally retarded patients at these dual purpose facilities were not excluded from the daily maintenance expenditure computations and therefore these ratios reflect a slightly lower value than if the data had been excluded.

14/ Oregon: Resident patients were defined as those who were physically present or on pass three days or less.

15/ Texas: Data reported were for fiscal year ending August 31, 1970. Includes data from San Angelo State School and Corpus Christi State School which opened October 7, 1969 and June 1, 1970 respectively. In computing daily maintenance expenditures for Texas 46 average daily patients and 66 patients under treatment and \$573,767 in expenditures were excluded for Corpus Christi State School.

16/ Per resident patient maintenance expenditures are based on the average daily resident patient population of institutions reporting expenditures.

17/ Per patient under treatment maintenance expenditures are based on the patients under treatment (resident patients beginning of year plus total admissions) for institutions reporting expenditures.

18/ Admission and resident patient end of year rates are per 100,000 estimated civilian population. Sources: U.S. Bureau of Census, Current Population Reports, Series P-25, provisional estimate for April 1970. (Civilian population for State of Nevada has been subtracted from the U.S. civilian population since Nevada has no public institutions for the mentally retarded).

19/ These rates are based on the average of the beginning and end of year resident patient populations.

Symbols used: \*Indicates data which are estimated or include estimates.

--Data not available.

## DESCRIPTION AND LIMITATIONS OF THE DATA

### A. Patient Movement Data

The summary data presented in the preceding tables may be used to analyze the annual changes in year end populations of public institutions in terms of three categories of patient movement (admissions, net releases, and deaths). These categories are defined as follows:

1. **Admissions:** This category includes first and readmissions. First Admissions are all patients admitted to a public institution for the mentally retarded without a record of previous care, i.e., a record of an admission and a formal discharge, in either a public or private institution anywhere. Thus, a patient coming into a public institution for the mentally retarded from a hospital for mental disease would be considered a first admission. Readmissions are all patients admitted with a record of previous care in a public or private institution.

2. **Net Releases Alive from Institution:** The concept of "net release alive from Institution" takes into account movement of patients into and out of the Institution since this quantity is the number of placements on extramural care plus direct discharge from the Institution less the number of returns from extramural care, all occurring during any one year. National data on placements and returns from extramural care are not available but net releases may be computed from less detailed movement data as:

Net		Resident	All Admis-	Deaths	Resident
Releases	=	Patients	+ sions	- in	- Patients
Alive from		Beginning	Excluding	Insti-	End of
Institution		of Year	Transfers	tution	Year

Interpretation of net releases alive from Institution should be made with caution. This quantity is the net number of releases alive from the Public Institutions in the State system and includes not only direct discharges to the community and placement on leave but also direct discharges to other inpatient facilities outside the State system such as public mental hospitals, boarding care homes, and public institutions in other States. The number of net releases is used as a measure of movement out of the Institution rather than the total number of discharges because many discharges occur while patients are already outside the Institution on extramural care. The number of net releases may be considered an estimate of the number of effective releases from the Institution under the assumption that subtracting returns from leave during the year removes only the short term visits; leaves, and escapes and retains the effective releases; i.e., those from which the patients did not return to the Institution within the time period covered.

3. **Deaths in Institution:** This category includes only deaths occurring to patients resident in the Institution and does not include deaths among patients on leave, even though these patients are still on the Institution books.

4. **Patient Movement Ratios per 100,000 Civilian Population:** The admission ratio measures the proportion of people coming under care during the year while the resident patient at end of year ratio measures the proportion of the population under care at one point in time.

5. Patient Movement Ratios per 1,000 Average Resident Patients: These ratios relate each of three movement categories: Total Admissions, Net Releases, and Deaths, to the average resident population, thus providing indexes of the amount and type of patient movement activity that occurred during the year. It should be kept in mind that the ratios shown in these tables are based on totals and as such they have the limitations of totals. They are not standardized for such important variables as age, sex, medical classification, and years in the Institution. To illustrate how these ratios are descriptive of changes in resident patient populations, consider the following hypothetical examples:

Suppose that the resident patient populations in State A and State B each increased by three percent (or 30 per 1,000). Considering only these data gives a limited and potentially misleading view of patient movement activity. However, now suppose that the patient movement ratios are computed to be the following:

<u>Movement Category</u>	<u>State A</u>	<u>State B</u>
Admissions	99.3	162.7
Net Releases	79.9	144.0
Deaths	16.3	15.7

These ratios show that State B has much higher rates of patient movement into and out of the Institution than State A. While these ratios highlight areas of difference between the two States, conclusions based only on these ratios may be fallacious. The differences can be isolated further by analyzing the data in terms of the patient characteristics mentioned above (age, sex, medical classification, and years in institutions). Even at this point, one cannot evaluate the relative efficacy of the two public institutional programs since differences in patient movement ratios between States may also be attributable to a great many other factors, such as policies and laws controlling admissions and release, the ways in which the public institutions are utilized by the communities they serve, the types of patients admitted, the various treatment programs within the Institutions, and the availability of various community facilities that can serve as adjuncts or alternatives to institutionalization. Since the reasons for inter-state differences in these movement ratios are complex and vary considerably from Institution to Institution within and between States, ratios constructed from gross movement data (i.e., State totals) cannot be used to measure the therapeutic effectiveness of various programs.

6. Ratio of Net Releases to 1,000 Admissions: The ratio "net releases per 1,000 admissions" is a convenient index for summarizing the live net movement into and out of the Institution. For example, if the ratio is less than 1,000 there were more admissions than net releases. Note that this index does not relate net releases to admissions in the sense of a percent or rate because not all releases during a year derive from the admissions during that year. Some of these net releases occurred to patients with lengths of stay greater than one year, that is, patients admitted during some prior year.

## B. Expenditure Ratios

The expenditure per average daily resident patient has been the most commonly used ratio for comparing Institution expenditures. Its major limitation is that it does not adequately take into account the number of admissions for which a large share of the expenditure is required. If the patient base is enlarged to include admissions during the year, the resulting sum is the best available estimate of patients under treatment during the year. This quantity is actually defined as:

$$\begin{array}{rclcl} \text{Patients} & & \text{Resident} & & \text{All Admissions} & & \text{Returns from Leave} \\ \text{under} & = & \text{Patients} & + & \text{Excluding} & + & \text{among Patients on} \\ \text{Treatment} & & \text{Beginning} & & \text{Transfers} & & \text{Leave Beginning of} \\ & & \text{of Year} & & & & \text{Year} \end{array}$$

The estimate, however, does not include the last term since these data are not available nationally.

The ratio of expenditures to patients under treatment appears to be a more realistic measure, but it does not solve the problem completely. While a larger share of the expenditures is required for the care of admissions, the index weights both admissions and resident patients equally.

## C. Interstate Variation

Considerable variation among the States in patient movement, personnel, and expenditure data is indicated in Table 10.

Actual numbers are not comparable among States since they do not take into account differences in size of population. Therefore, ratios have been computed for several data categories. For example, net releases and total admissions per 1,000 average resident patients show considerable variation, with net release rates ranging from 21 to 557. Rates of admission and resident patients at end of year per 100,000 civilian population also vary considerably from State to State. Considerable interstate variation is further illustrated by the range in expenditures per patient under treatment per day from a high of \$16.38 (excluding Alaska) to a low of \$4.61.

However, as has been emphasized in Sections A4-A6 above, comparison of State ratios, while serving to highlight areas of differences, are limited. More detailed classifications of movement categories by such variables as age, sex, medical classification and time on books are needed. Data on most of these variables as well as more detail on personnel and maintenance expenditures will be available in other publications. This detail will provide partial explanations of the gross differences noted in the tables. Also, as mentioned previously, other factors such as policies and laws affecting admission and releases of patients, other community treatment facilities, effectiveness of therapeutic programs, etc., must be evaluated to determine the extent of their influence on interstate variation.

## CHAPTER 3

### MENTALLY RETARDED PATIENTS IN STATE MENTAL HOSPITALS

A major role in the public care of the mentally retarded is played by the public mental hospitals. In 1968, for example, 25 percent of the total first admissions diagnosed with mental retardation to both public institutions for the mentally retarded and to State mental hospitals were to the latter type of facility. The State mental hospital plays a predominant role for mentally retarded persons who are 25 years and older. In 1968, for example, of first admissions diagnosed with mental retardation to public facilities, almost 75 percent of those 45 years and older were to State mental hospitals, and only 25 percent were to public institutions for the mentally retarded. Among those 25 to 44 years of age, 70 percent of the admissions were to State hospitals. In the 18-24 year age group, 50 percent were to State mental hospitals. Among the resident patients in public facilities, almost 50 percent of the mentally retarded aged 45 and over were in State mental hospitals, and of those 25-44 years of age, almost 25 percent.

The differences in the age distribution of first admissions to public mental hospitals and of those to public institutions for the mentally retarded result in differences in the age distribution of resident patients in these two types of facilities. Nearly three-fourths of the resident patients diagnosed as mentally retarded in public mental hospitals are 35 years or older compared with slightly under one-fourth in that age group in public institutions for the mentally retarded.

In addition to the age differences between mentally retarded persons in public institutions for the mentally retarded and those in public mental hospitals, there are also striking differences in the degree of severity of mental retardation at admission. About 72 percent of the mentally retarded admissions to public mental hospitals are classified as mildly or moderately retarded as opposed to 49 percent of such admissions to public institutions for the mentally retarded (Table 21).

There is considerable variation by State in these figures. The variations among States and the proportion of patients with mental retardation admitted to and resident in their public mental hospitals may be the result of several factors, such as the availability of separate institutions for the care of the mentally retarded, the application of age restrictions to patients accepted for care in institutions for the mentally retarded in some States, differential policies with respect to retaining long-term mentally retarded patients in institutions for the mentally retarded, differences in policies with respect to the locale of care for mentally retarded patients with psychotic disorders, and programs establishing separate care units for the mentally retarded in the State mental hospitals.

The data in this chapter are from the annual census of patients in mental institutions, conducted by the National Institute of Mental Health.

Table 21. Comparison of First Admissions to Public Institutions for the Mentally Retarded and Mentally Retarded First Admissions to State Hospitals by Degree of Severity and Age, United States, 1967

Mentally Retarded in Public Mental Hospitals

Severity	Age					Percent
	All ages	-15	15-24	25+	All ages

## CHAPTER 4

### CHARACTERISTICS OF MENTALLY RETARDED INSTITUTIONALIZED ADULTS

In 1967, the Social Security Administration conducted a Survey of Institutionalized Adults, which collected information on the socio-economic characteristics of mentally retarded and other disabled persons age 18 and over in such institutions as homes and schools for the mentally and physically handicapped, mental hospitals, chronic disease and other long-term hospitals. Data were obtained from institutional records and from relatives and guardians. The survey focused on types of care, cost of care, sources of payment, economic resources of the patient and his family, and his social relationships with family and friends. The handling of the institutionalized person's economic resources by administrators (including the institution) and representative payees was also examined. The data in this chapter are taken from two reports on the results of this Survey published by the SSA. 1,2/

Approximately one-fourth (23.2 percent) of the institutionalized adults under age 65 were in schools or homes for the mentally retarded. Most of these mentally retarded patients lived in large institutions with a median population of about 1,820 (Table 23). The median number of beds in these facilities is larger (2,410) than the number of patients because of unoccupied beds and patients on leave.

As indicated by Table 24, persons in facilities for the mentally retarded had very little formal education, over 90 percent had never been employed, and 87 percent had no children.

Mental, psychoneurotic, and personality disorders were the reasons for institutionalization for approximately 87 percent of all the institutionalized adults, and 93 percent of residents in institutions for the mentally retarded (Table 25). There are also social reasons for institutionalization which are more difficult to categorize--the circumstances that led relatives and guardians to reject home care for the retarded persons. As indicated by Table 26, the most common reasons given were the need for permanent care not possible at home, and the need for the retarded adult to be watched and looked after more carefully than was possible at home.

The reason most frequently given by relatives or guardians for choosing the particular institution for mentally retarded in which the patient resided was a doctor's recommendation, mentioned by about 41 percent of those reporting (Table 27). The next most frequent reason was a recommendation by an agency or court.

Nearly three-fourths (71.8 percent) of the mentally retarded reported were under age 18 at the onset of disability (Table 28). The actual number of mentally retarded who were disabled before age 18 was probably much greater, since there were almost 27 percent for whom the relative or guardian did not report this information.

The mentally retarded had a median current stay of institutionalization of almost 15 years (Table 20). About one-third of all the residents in institutions for the mentally retarded had a current length of stay of 10-19 years, while about another one-third had a current length of stay of 20 or more years.

The median total time in institutions for the mentally retarded was 16.4 years (Table 30). About one-third of the residents had a total stay of 20 or more years.

The residents in institutions for the mentally retarded were least likely to have had prior stays, especially in their current institution (Table 31). About 64 percent had no prior stay in any long-term institution.

Table 32 indicates that few discharges were expected from institutions for the mentally retarded. Only one percent were expected to be discharged within six months. Residents of institutions for the mentally retarded had less change of discharge than did the residents of the other types of institutions.

In addition, sixty-eight percent of the residents of institutions for the mentally retarded had no leave during the last year (Table 33).

Data from relatives and guardians were collected approximately 8-12 months after the data collection from institutions. During this period, less than one percent of those in institutions for the mentally retarded had died (Table 34). Two percent were no longer institutionalized, and another 2 percent were in a different institution. Ninety-three percent were still in the same institution.

The 1967 Survey of Institutionalized Adults also gathered information on regular institutional charges for lodging, meals, and nursing care, and on funds received by the institutions. Institutions for the mentally retarded had the lowest median monthly charge (\$125) and the lowest median "most frequent" charge (\$157). The median "most frequent" charge was higher due to charges being reduced for some patients (Table 35).

Patients in institutions for the mentally retarded had the largest proportion of reduced charges--39 percent (Table 36). Whether a patient is assessed the standard charges, a reduced charge, or no charge at all is apparently a function of his ability to pay. Two percent of the patients were public assistance recipients, which was the reason for their reduced charges.

Relatives and guardians were asked to report charges for any medical care received by the patient outside the institution in 1967. The mentally retarded, few of whom had lived outside an institution during 1967, had the lowest proportion (only 4 percent) receiving outside medical care (Table 37).

The institutions were asked to report funds they had received for each patient in the months before the survey. Most of these funds were received as payment for the patient's care, but personal funds were included if the institution was financial administrator for the patient. Funds were not necessarily received in this month for every patient who had been assessed charges, of course, and personal funds were received by the institution as administrator for some patients without charges. Almost one-third of the mentally retarded received less than \$100, while just under half (44.8 percent) received no funds (Table 38). Thus, the mean amount received by mentally retarded patients was \$97, while the median amount was only \$65.

As a comparison of median charges (Table 35) with median funds received (Table 38) would suggest, there were overdue charges for some of the patients. A larger percent of mentally retarded patients had such overdue charges (22.6 percent) than did patients in other types of facilities (Table 39). In fact, patients in mentally retarded institutions averaged over \$3,000 in overdue charges, almost 3 times as much as did patients in other types of institutions.

## CHAPTER 5

### STATE LICENSURE OF RESIDENTIAL FACILITIES FOR THE MENTALLY RETARDED

There are 52 State regulatory agencies with authority over residential facilities for the mentally retarded. These agencies exist in all the States except the following: Alabama, Arkansas, Idaho, Illinois, Mississippi, New Hampshire, Oklahoma, South Carolina and Vermont. In these nine States, there is no regulatory authority over residential facilities for the mentally retarded.

The information in this chapter was obtained from a 1968 mail survey/sponsored by the National Center for Health Statistics of all 146 State licensing agencies in the United States and the District of Columbia. Regulatory information was collected concerning 11 types of medical care and residential care facilities. These facilities included all types of hospitals, nursing and related care homes, facilities for crippled, blind or deaf children, homes for dependent children, emotionally disturbed children, unwed mothers, and facilities for the mentally retarded. This chapter summarizes the information gathered concerning the regulations for facilities for the mentally retarded. A report containing detailed information from all portions of this survey will be published by the Center within the year.

Regulatory authority over hospitals and homes for the mentally retarded is more often shared among several agencies within a State than is true for many of the other types of health facilities. For example, at least five States divide the regulatory authority between one agency that is concerned with hospitals for the mentally retarded, and another that deals with homes for the mentally retarded.

The health department is the licensing agency for hospitals and homes for the mentally retarded in 23 States, while the public welfare department has this authority in 11 States (Table 40). Other departments concerned with licensing hospitals and homes for the mentally retarded include health and welfare, mental hygiene, social services, hospitals, institutions and agencies, and public assistance.

Four States had enacted licensing statutes concerning hospitals and homes for the mentally retarded prior to 1900, with 10 more States enacting such legislation by 1929 (Table 40). The decade of the 1940's witnessed the passage of the greatest number of licensing statutes (20) for hospitals and homes for the mentally retarded.

All the State agencies except one reported that they require the formal filing of an application for approval to open a hospital or home for the mentally retarded (Table 41). The State licensing agencies often verify the information on the application by a combination of the following methods: review of the building plans prior to construction, inspection of the facility, a records check to see that fees have been paid, certification by another agency such as the Fire Marshall, or correspondence with the facility.

The agencies in 38 States reported that they require annual renewal of approval to operate a hospital or home for the mentally retarded (Table 41), while four require biennial renewal. Two State agencies have no renewal requirements. The methods used by the State licensing agencies to verify the renewal information are the same as those given above.

The areas in which standards have been established concerning hospitals and homes for the mentally retarded as a condition for licensure approval are given in Table 42. These standards usually cover the staff (e.g., their skills, qualifications, duties and numbers), patient care, equipment and services, building design (e.g., construction, fire safety, electrical and mechanical facilities, and water and sanitation) and such administrative matters as the medical records.

The State licensing agencies in 39 States reported that there are provisions in the statutory regulations for suspension or revocation of approval to operate a hospital or home for the mentally retarded. These legal grounds most often deal with a violation or failure to comply with the rules. Other causes for suspension or revocation are: committing or permitting an illegal act; action detrimental to patients' welfare; moral unfitness of the staff; insufficient staff; lack of qualifications by the staff; and commission of a felony by the staff.

The State licensing agencies reported that during the previous year (1967) only one facility for the mentally retarded had formal hearings to show cause why its license should not be revoked, and three had renewal of their licenses refused or revoked (Table 43). No hospitals or homes for the mentally retarded were prosecuted in court during this time.

Table 40. Date of First State Licensing Statute, of Last Amendment, and State Agency with Regulatory Authority over Hospitals and Homes for Mentally Retarded

<u>State</u>	<u>First Enactment</u>	<u>Last Amendment</u>	<u>Regulatory Agency</u>
Alaska	1940-1949	1950-1959	Dept. of Health and Welfare, Health and Welfare Facilities Development
Arizona	1940-1949	1950-1959 1960-1964 <sup>1/</sup>	Department of Health, Division of Nursing and Health Care, Licensing Section Department of Public Welfare, Family and Child Welfare Division <sup>2/</sup>

16/ Refers to private institutions.

17/ Refers to public institutions. Procedures were being revised at the time of the survey.

18/ The Division of Mental Retardation inspects and approves all hospitals and homes for the mentally

retarded, but the Bureau of Community Institutions issues the licenses.

19/ Dept. of Mental Hygiene and Correction licenses certain facilities for mentally retarded persons over

6 years of age; Dept. of Public Welfare licenses homes for mentally retarded children up to 18 years of

age. Reporting is by the Dept. of Public Welfare, as the Dept. of Mental Hygiene and Correction reported

that no legislation exists for its regulatory authority.

20/ Reported by the Dept. of Social Welfare, which licenses proprietary homes.

21/ Reported by the Dept. of Health, which licenses hospitals for the mentally retarded.

- <sup>1/</sup> California reported that a "less formal approach was used." A total of 60 facilities did not "relicense" in FY 67-68 (including psychiatric hospitals, hospitals and homes for the mentally retarded, residential treatment centers for emotionally disturbed children, family care homes for mentally ill, long-term facilities, nurseries for the mentally retarded, and alcoholism hospitals.
- <sup>2/</sup> The Department of Health, which licenses hospitals for mentally retarded and homes caring for three or more mentally retarded adults, reported that a procedure of informal hearings had resulted in resolving situations without resorting to carrying out administrative regulations pertaining to formal hearings.
- <sup>3/</sup> Respondent reported that 150 homes (hospitals and homes for mentally retarded, nursing and convalescent homes, and other homes for the aged) had closed since 1964; the homes were closed, however, by means of informal procedures, rather than formal hearings.

## PART II

### OUTPATIENT SERVICES FOR THE MENTALLY RETARDED

The vast majority of the estimated six million mentally retarded persons in the United States are not institutionalized. They are only mildly or moderately retarded and can attend classes and hold jobs. For these people there is a great need for supportive outpatient or day services to assist them in living as normally as possible.

This section of the report concerns four such day programs for the mentally retarded. The first of these programs was authorized by the Mental Retardation Facilities and Community Mental Health Centers Construction Act of 1963. Facilities constructed under this Act offer the following types of services to the mentally retarded: diagnostic and evaluation services, treatment, education, training, personal care, and sheltered workshop.

The second program is authorized under Title V of the Social Security Act, which supports clinics that serve mentally retarded children. These clinics provide comprehensive evaluation, treatment, and follow-up services.

Outpatient psychiatric clinics also serve the mentally retarded, as is indicated by Chapter 8 of this report.

The final type of care covered in this section concerns educational programs in the public schools for mentally retarded children.

## CHAPTER 6

### DAY FACILITIES FOR THE MENTALLY RETARDED

One of the more significant recent advances in the field of mental retardation is the extensive establishment of day facilities for the care, treatment, and rehabilitation of the mentally retarded. A day facility is defined for purposes of this chapter as a facility housing treatment, education, training, personal care, or sheltered workshop services on less than a 24-hour-a-day basis. By the end of 1968 there were approximately 2,000 such day facilities in the United States.

Day facilities for the mentally retarded aid the parents by offering supervised programs that have been developed to meet the special needs of the retarded individual. By making it possible to keep the retarded individual at home, these facilities preserve the value of retaining his family ties and having continuing participation in family life. 1/

The various services for the mentally retarded listed below may be housed in many types of day and residential facilities for the mentally retarded. For the purposes of this report we have adopted the classification and nomenclature developed under Title I, Part C of the Mental Retardation Facilities and Community Mental Health Centers Construction Act of 1963 (Public Law 88-164). These are as follows:

Diagnostic and Evaluation Services. These services involve the diagnosis and evaluation of the individual; the appraisal of the individual's resources and those of his family and the community; and the development of recommendations for a plan to help the individual realize his fullest potential.

Treatment Services. These services include medical and appropriate related ancillary services and therapies to provide for the improvement of the individual physically, psychologically, and socially.

Education Services. Education services include the development of instruction curricula geared to the needs of the mentally retarded at various levels of retardation and in different age groupings.

Training Services. Included in these services are training in motor skills, in self-help, and in the activities of daily living, as well as vocational training and socialization experiences that will be conducive to personality development.

Personal Care Services. Personal care services include the provision of food, shelter, clothing, and medical care. Also included are special medical and nursing services directed at the prevention of regression in the retarded individual and stimulation of his maturation.

Sheltered Workshop Services. These services include vocational evaluation, training, and paid work experience.

In 1968 there were approximately 2,000 day facilities for the mentally retarded serving 92,300 patients. Of these, 73 percent had training-type services, 70 percent offered personal care services, but only 5 percent provided diagnostic and evaluation services. (Table 44).

The East North Central division of the country had the largest number of day facilities. Ohio had 163 day facilities in 1968, thereby leading all of the States. Michigan reported the second largest number--120. Three other States, Illinois, Pennsylvania, and Wisconsin, each had more than 100 day facilities (Table 45).

Included in the count of day facilities are diagnostic clinics for retarded children. These facilities are operated as outpatient programs, providing comprehensive evaluation, treatment, or follow-up services for mentally retarded children primarily. Most of these clinics have been in operation for only a few years.

## CHAPTER 7

### MATERNAL AND CHILD HEALTH SERVICE MENTAL RETARDATION CLINIC SERVICES

Under Title V of the Social Security Act, the Maternal and Child Health Service (MCHS) supports with Federal funds 154 clinics that serve mentally retarded children. These clinics are surveyed periodically by the MCHS to gather information on the characteristics of their patients. The information in this chapter is summarized from the MCHS report "Mental Retardation Clinic Services, 1971".

By definition, the report includes children (that is, persons under 21 years of age) who receive services in a MCHS funded mental retardation clinic or services rendered outside the clinic by staff assigned to the clinic.

A mental retardation clinic is defined as an outpatient medical facility providing comprehensive evaluation, treatment, or follow-up services primarily to children suspected of or diagnosed as being mentally retarded, by an interdisciplinary team, of which a physician takes the medical responsibility for all patients seen and is in attendance at regularly scheduled hours.

Definitions for medical classification are those of the American Association on Mental Deficiency and are found, but for a few additions, in "A Manual on Terminology and Classification in Mental Retardation", a monograph supplement to the American Journal of Mental Deficiency, Second Edition, 1961.

The 154 clinics surveyed in 1971 were in 48 jurisdictions, including the District of Columbia and Puerto Rico. The distribution of the clinics by State is shown in Table 46. One-third of the clinics (52) were in the following five States; California had 10, New Jersey had 7, North Carolina had 11, Virginia had 10, and Washington had 14.

The geographic areas served by the clinics vary considerably. For example, 40 clinics serve an entire State; 61 clinics serve a section of a State and two or more counties; 17 clinics serve one county; 12 clinics serve a metropolitan area; and 24 clinics have no geographic limit to the area they serve. Included in the number with no geographic limit are a few clinics which reported that they serve children in neighboring States.

Policy regarding services provided to patients by individual clinics has been summarized with respect to (1) maximum age for new patients accepted, (2) scope of services, and (3) restrictions on referrals from other types of sources. The age limit at admission is reported to be between 4 and 12 years of age inclusive by 24 clinics, between 13 and 18 years of age by 23 clinics, and age 20 by 107 clinics, including a few who reported no age limit other than the stipulated age of 20 for children.

The scope of services offered was reported as including all three options on the survey questionnaire (i.e. evaluation, treatment, and re-evaluation) by 109 clinics; evaluation and re-evaluation by 41 clinics, evaluation only by one clinic; and evaluation and treatment by three clinics. Thus, 112 of the 154 clinics, or 73 percent of all clinics, provide treatment, while 42 clinics function as evaluation clinics.

Twenty of the 154 clinics reported restrictive policies on referrals from other sources. Six clinics were restricted to referrals from physicians only, one to a specific hospital, one to a local health department, and 12 to a physician and/or a health or social agency, or closely allied agency (school or court).

Ninety-four of the clinics reported that a governmental agency had the primary administrative responsibility for the clinic, as follows:

Local, public health or welfare	24
State	70

Maternal and Child Health only (42)
MCH and other non-university (21)
Crippled Children (6)
CC and other non-university (1)

Sixty of the clinics reported that a non-governmental agency had the primary administrative responsibility, as follows:

University medical school only	25
University medical school and MCH	18
University medical school and other not MCH or CC	6
Hospital	7
Independent association or foundation	4

Since 18 clinics which are university connected are also tied to State Maternal and Child Health or State Crippled Children programs, 112 clinics, or 73 percent of all clinics, are government connected for administration. A few clinics under independent administration receive special Federal MCHS grants.

Since Federal funds are made available by the Federal Maternal and Child Health Service mostly through the corresponding State MCH agency, it is not surprising that 81 clinics, or 53 percent of all clinics, reported that a State MCH agency had sole or joint administrative responsibility. Since direct grants are made for training projects to universities, it is to be expected that a goodly number of universities will have administrative responsibility for clinics, either alone (25) or jointly (24).

Patients served in the mental retardation clinics during the fiscal year 1971 included 27,988 newly admitted patients and 32,871 other patients, for a total of 60,859 patients. The numbers of newly admitted and other patients served in each State are shown in Table 46.

The largest number of patients served in any State was in Pennsylvania, with 4,913 patients served. Twenty-one States served at least 1,000 patients. In contrast, the single clinic in Montana served only 36 patients. The average number of patients served per clinic for all 154 clinics was 395 patients.

Indiana had the largest number of new patients (1,854), followed by Texas with 1,518. In eight States, the number of new patients served was at least 1,000. The average number of new patients served per clinic nationwide was 182 and the average number of other patients served was 213.

The percent of patients reported as new patients varied from a high of 83.6 in Alaska to a low of 23.2 in New York.

Of the 60,859 total patients, 37,803 or 62.1 percent were male, and 23,056 or 37.9 percent were female. Males accounted for 63.5 percent of the new patients and 60.9 percent of the other patients (Table 47).

Among all patients the largest single age group is among patients 5-9 years of age; they account for 45.1 percent of the total patients.

Although an important purpose of the clinics is to reach mentally retarded children early, only one-third (36.2 percent) of the new patients served were under 5 years of age. Almost one-half were from 5 to 9 years of age inclusive, so that many did not appear for service until they were in school or were of school age.

The new patients tend to be slightly younger than the other patients. The median age for all patients is 7.2 years, while for new patients it is 6.6 years, and for other patients 7.7 years. Comparison of the median ages shows that among the new patients, the girls tend to be a little younger than the boys, showing a median age of 6.2 years compared with 6.8 years for boys.

Visits to clinics by all patients served totalled 243,086, including 107,569 visits by 27,289 new patients and 135,517 visits by 30,781 other patients (Table 48). In all, 12,273 patients (or their families) were visited outside the clinic by staff in 30,372 visits.

Of the new patients visiting the clinics, 34.7 percent made one visit, and of other patients 43.1 percent made one visit. Patients who visited the clinics 5 or more times were 25.0 percent of the new patients and 17.2 percent of the other patients. The average number of visits to clinics for new patients was 3.9 and for other patients was 4.4 visits.

Of the 27,988 new patients admitted to the clinics, the largest group, 8,815 or 31.5 percent, were referred to the clinics by private physicians, including those with group medical practice (Table 49). Second in number were the referrals from schools (5,148 or 18.4 percent of all new patients).

Hospitals supply the third largest group of referrals (16.5 percent) and public health services, such as well-baby clinics, the fourth largest (9.0 percent). "Other community agencies" include public or voluntary agencies such as a visiting nurse association. Other sources not specified might be, for example, relatives or special institutions for the retarded.

New patients are classified in Table 50 by the primary diagnosis of the condition causing or associated with mental retardation. Of the 27,988 new patients, only 13,744 (49.1 percent) were classified as mentally retarded; 8,539 (30.5 percent) were classified as not being mentally retarded. A possible explanation may be the fact that many of these children were referred to the mental retardation clinic after experiencing difficulties in school that made them seem to be mentally retarded.

When the primary diagnoses for mental retardation are ranked according to the percentage of new patients affected, the first or largest group is comprised of patients mentally retarded by reasons of "uncertain cause with functional reaction alone manifest," a group containing 4,430 children or 32.2 percent of the total number of children classified as mentally retarded. The second most prevalent condition associated with mental retardation is prenatal influence, which affected 3,397 children, or 24.7 percent. Third is the primary diagnosis "unknown cause with structural reactions manifest", which affected 2,316 or 16.9 percent. The fourth is attributed to trauma or physical agent; this group number 1,611 patients, or 11.7 percent of the mentally retarded. The other diagnosis in order of prevalence are infection (6.2 percent), disorder of metabolism, growth, or nutrition (3.8 percent), intoxication (3.2 percent), and new growth (1.3 percent).

The medical classification and subgroups of the primary diagnosis of the condition causing or associated with mental retardation are given in Table 51. Under "trauma or physical agent" the largest subgroup is anoxemia at birth, with 792 patients constituting 5.7 percent of total mentally retarded new patients. Under "metabolism, growth, or nutrition", the group with phenylketonuria (PKU) includes 142 patients, or 1.03 percent of total. Under "prenatal influence", mongolism is associated with 1,120 patients or 8.15 percent of the mentally retarded. Prematurity is associated with 866 patients or 6.3 percent of the total.

The number of mentally retarded patients with impairment of the special senses is shown in Table 52. The largest sub-category, the visually handicapped, contains 1,063 patients or 31.6 percent of the patients with impairment of the special senses. Other sub-categories with impairment of sight include patients who are blind (3.9 percent), those blind and hearing handicapped (4.9 percent), and those hearing and visually handicapped (6.8 percent).

The two categories "blind" and "blind and hearing handicapped" account for 8.8 percent of the patients with impairment of the special senses and 2.2 percent of the new patients' classified as mentally retarded. About one of every 45 new patients classified as mentally retarded is blind.

At least 1,065 or 31.7 percent of the patients with impairment of the special senses have a hearing handicap. This represents 7.7 percent of the new patients classified as mentally retarded. At least one child in every 13 of the new patients who are mentally retarded has a hearing handicap.

Of the 21,279 new patients for whom intelligence level was determined, 8,270 or 38.9 percent were reported as showing "no retardation in measured intelligence" (Table 53). In addition, 20.5 percent were classified as having borderline retardation, 17.8 percent as having mild retardation, 12.2 percent as being moderately retarded, 7.0 percent as being severely retarded and 3.7 percent were profoundly retarded.

Patients terminated (that is, for whom clinic services were discontinued during the report year) numbered 15,739 and are distributed according to reason for termination as shown in Table 54. Some clinics do not report any patients as terminated. It should be kept in mind that many of these clinics treat children who are not mentally retarded; in such cases, many of these children are not reported as terminated.

Table 46. Number of Patients Served in Mental Retardation Clinics, by Their Status and State, Fiscal Year 1971

## CHAPTER 8

### MENTAL RETARDED PATIENTS IN OUTPATIENT PSYCHIATRIC CLINICS

The annual census of patients in mental institutions, conducted by the National Institute of Mental Health, collects information on the number of patients, by diagnosis, served in outpatient psychiatric clinics. The data presented in this chapter are from the 1969 census.

Of the 818,865 patients served in outpatient psychiatric clinics in 1969, 29,879 or 3.6 percent were diagnosed as mentally retarded (Table 55). The diagnosis of mental retardation ranked seventh in frequency among patients in these clinics. Over half of these mentally retarded persons were between 5-14 years old.

There were more male (17,811) than female (12,068) mentally retarded patients served by these clinics (Tables 56 and 57). For both sexes, however, the largest number of patients, by age group, were those 5-14 years old.

## CHAPTER 9

### EDUCATIONAL SERVICES FOR MENTALLY RETARDED CHILDREN

This chapter reports data from two sources: (I) a national survey of public schools, and (II) program management data from the Bureau of Education for the Handicapped, U.S. Office of Education (USOE).

- I. During Spring, 1970 a survey of school staffing was conducted by the National Center for Educational Statistics, USOE, with support from the USOE's Bureaus of Educational Personnel Development and Education for the Handicapped. The survey sample consisted of approximately 2,000 public elementary and secondary schools, representative of the 81,000 local public schools in the United States, by three strata: school level -- elementary and secondary; school location--large cities (the 130 cities with 100,000 or more population as of the 1960 Censuses), the metropolitan areas surrounding these cities, and all other areas of the 50 States and the District of Columbia; and enrollment size--five groups. Schools in systems enrolling fewer than 300 pupils were excluded from the survey. The school principal or his representative completed the survey questionnaire which elicited information about a number of handicapping conditions. Tables 58 through 65 provide a preliminary presentation of data from the survey on mentally retarded pupils and the schools that enroll them. For the purpose of this survey, mentally retarded pupils were described as follows:

"Mentally retarded pupils' level of mental development is such that they have been identified by professionally qualified personnel as unable, without special help, to benefit from the usual school program."

There were 936,000 public school pupils reported by principals as mentally retarded in 1970 (Table 58). The overall rate was 21 mentally retarded for every 1,000 pupils. The rate for elementary schools was higher than for secondary schools, 24 compared to 14 mentally retarded per 1,000 pupils.

The number of local public schools reporting at least one mentally retarded pupil was 48,600 or 60 percent of the total of 81,000 schools (Table 59). Close to 40 percent of the 48,600 schools had 1-9 mentally retarded pupils, 30 percent had 10-19 and a similar proportion had 20 or more mentally retarded pupils (Table 60).

Eighty-four percent of the mentally retarded pupils in public schools received one or more of the following types of special instruction or assistance: separate (special) classes, individualized special instruction or assistance in regular classrooms by regular teachers, and individualized special instruction or assistance by specialized professional personnel.

Of the schools with at least one mentally retarded pupil, twenty-two percent did not receive any of these types of instruction or assistance, 37,600 or 77 percent provided one or more of the designated types of special instruction or assistance for mentally retarded pupils was greater for schools with larger enrollments than for those with smaller enrollments (Table 62). The type of assistance offered by the largest number of schools was all of the pupils' instruction in separate (special) classes (Table 63). One-third of the schools providing any of the designated types of special instruction provided only separate classes for all of the instruction of mentally retarded pupils (Table 64).

There was the equivalent of 48,000 full-time professional staff providing instruction in separate (special) classes (Table 65). This gives a rate of 79 full-time equivalent (FTE) professional staff instructing in special classes per 1,000 mentally retarded pupils.

The number of professional staff (in FTE's) to mentally retarded pupils was greater for smaller schools than for larger schools at both the elementary and secondary school levels (Table 65).

Estimates of relative sampling error for the data reported in this chapter will be available in a forthcoming publication of the National Center for Educational Statistics.

- II. Part B of the Education for the Handicapped Act (EHA) provides formula grant funds to States which are used to help provide improved diagnostic services, new techniques of teaching, specialized curriculum and equipment, and better qualified professional and paraprofessional educators at local and State levels. During fiscal year 1970, with about 80 percent of project reports received, the following numbers of mentally retarded children were reported to have participated in projects funded via EHA, Part B.

	AGE IN YEARS				Total Children
	0-5	6-12	13-18	19 & Over	
Trainable Mentally Retarded (TMR)	1,195	6,644	3,829	636	12,304
Educable Mentally Retarded (EMR)	1,924	39,876	29,487	1,145	72,432

Public Law 89-313, Amendment to Title I of the Elementary and Secondary Education Act, provides financial support for the education of handicapped children in State-operated and State-supported schools. The

numbers of mentally retarded children on whom State allocations were based for Fiscal Years 1969, 1970 and 1971 are shown in Table 66.

Both the EHA, Part B, and the P.L. 89-313 programs are designed to help States develop educational programs to meet the educational needs of all handicapped children.

### PART III

#### SELECTED FEDERAL PROGRAMS FOR THE MENTALLY RETARDED

This section concerns four Federal assistance programs which include the mentally retarded among their recipients. While none of these four programs deals solely with the mentally retarded, an important part of the total number of persons assisted by these programs are mentally retarded.

For example, the mentally retarded constitute over half of the recipients of the Social Security Administration's (SSA) Childhood Disability Allowance program. This program provides monthly payments to dependent children age 18 and over of retired, disabled, or deceased insured workers if the children were disabled before age 18.

There are also mentally retarded persons receiving SSA Worker Disability Allowances. This program provides monthly payments to replace, in part, the earnings that are lost when a worker retires, dies, or becomes disabled.

Since 1943, the Federal Government has extended vocational rehabilitation services to the mentally retarded. The number of mentally retarded who have participated in this program of vocational rehabilitation has steadily grown over the years until, in 1971, an estimated 35,700 mentally retarded persons were rehabilitated.

The Federal Government's Public Assistance program is composed of several different components, such as Aid to Families with Dependent Children, Aid to the Blind, and Aid to the Permanently and Totally Disabled. Estimates of the number of mentally retarded persons who are recipients of two of these various programs are given in Chapter 13.

## CHAPTER 10

### MENTALLY RETARDED RECIPIENTS OF SSA CHILDHOOD DISABILITY ALLOWANCES

The 1956 amendments to the Social Security Act provided protection against long-term total disability for dependent sons and daughters (who become disabled before age 18) of retired, disabled, or deceased insured workers. Thus, under these "Childhood Disability" provisions, life-time monthly payments can be made to a person age 18 or over who has been disabled by mental retardation (or other impairments) since childhood.

In many cases, the monthly benefits enable the retarded childhood disability beneficiary to be cared for at home instead of in an institution. Furthermore, as more and more retarded people outlive their parents, the program offers reassurance to the parents who know that financial help for their disabled child will be forthcoming even after their death.

If the parents are dead, a relative who has demonstrated a continuing interest in the beneficiary's welfare, a welfare agency, or a legal guardian may be chosen as representative payee to handle the benefit funds and plan for using them on behalf of the beneficiary. As a trustee, the representative payee is held accountable for the way in which he uses the benefits.

The regulations contain guides as to the level of severity required in disability cases involving mental retardation. These regulations have the effect of law and are available to the public and the medical community from the Social Security Administration.

Note that for all three age groups in Table 67, mental deficiency is the primary diagnoses of over half the childhood beneficiaries (55.2 percent for those 18-24 years of age, 55.0 percent for those 25-44 years of age, and 52.6 percent for those aged 45 and over). Although almost half of the total childhood beneficiaries had mental deficiency as their primary diagnoses, slightly fewer males (53.7 percent) than females (56.4 percent) had mental deficiency as their primary diagnoses (Table 68).

Of the 22,063 childhood disability beneficiaries in 1968, 12,113 (54.9 percent) were diagnosed as mentally deficient. However, the number of mentally deficient children under age 18 who receive payments as dependents of retired, disabled, or deceased workers is unknown, since these benefits are payable regardless of disability.

In general, the number of childhood disability beneficiaries diagnosed as having mental, psychoneurotic, and personality disorders in each State is representative of the State's total population (Table 69). Of the 15,185 childhood disability beneficiaries with this diagnoses, 79.8 percent (12,113) are mentally deficient.

As mentally deficient persons accounted for 54.9 percent of all childhood disability beneficiaries in 1968, Tables 71 and 72 which give the educational

level and mobility status of all childhood disability beneficiaries, may be indicative of these characteristics among the mentally deficient. Of those whose educational status was known, over one-third of all the beneficiaries had received no schooling. One-half of them had either had no schooling or completed only the fourth grade or less. Twenty-seven percent of all the beneficiaries were institutionalized in such facilities as a soldiers' home, or a mental, tuberculosis, or chronic disease hospital, while approximately one percent were patients in a general hospital. Of the remaining non-institutionalized, non-hospitalized beneficiaries, approximately eight percent were confined to the home, while 25 percent were ambulatory, with help, outside the home, and 40 percent were ambulatory by themselves outside the home.

Table 67. Number of Childhood Disability Allowances by Ten Primary Diagnoses Occurring Most Often, by Age: 1968

Primary diagnosis	Inter- national code	Number	Per- cent	Cumu- lative per- cent
Aged 18-24

## CHAPTER 11

### MENTALLY RETARDED RECIPIENTS OF SSA WORKER DISABILITY ALLOWANCES

One of the main purposes of the Social Security program is to provide cash benefits to replace, in part, the earnings that are lost to individuals, and their families when the worker retires, dies, or becomes disabled. Protection against long-term total disability for severely disabled workers with extensive work experience was provided by the 1956 amendments to the Social Security Act.

Mental deficiency is one of the many primary diagnoses enabling a worker to receive such disability allowances. The regulations contain guides as to the level of severity required in disability cases involving mental retardation. These regulations have the effect of law and are available to the public and the medical community upon request from the Social Security Administration.

The number of disabled worker beneficiaries whose primary diagnosis is mental deficiency is quite small; there were 1,833 such worker disability allowances in 1968, out of a total 330,783, or one-half of one percent. Seventy-six percent of these mentally deficient disabled workers were males.

Table 73 gives the number of mentally deficient disabled workers, by age and sex, for 1967 and 1968. Note that there was a 33 percent increase in the number of worker disability allowances for mental deficiency during the period.

## CHAPTER 12

### MENTALLY RETARDED PERSONS REHABILITATED UNDER THE RSA PROGRAM OF VOCATIONAL REHABILITATION

The rehabilitation center came into being to serve the more severely disabled by providing services to the handicapped beyond those available through their own resources. The goal of rehabilitation centers is the restoration of the disabled to their optimum physical, mental, social, vocational, and economic usefulness.

The Federal Government supported the rehabilitation of physically and mentally disabled persons by passing the Smith-Fess Act in 1920 (Civilian Vocational Rehabilitation Act). The 1943 amendments to that act extended vocational rehabilitation services to mentally retarded and mentally ill persons. Additional legislation since then has extended vocational services to other groups of disabled persons.

Data presented in this chapter were obtained from the Rehabilitation Services Administration, which collects statistics on rehabilitated clients through a network of vocational rehabilitation agencies located in 54 jurisdictions: the 50 States, the District of Columbia, Puerto Rico, Guam, and the Virgin Islands. The data are from tabulations of individual case service reports prepared by the State vocational rehabilitation agencies for each client receiving vocational rehabilitation.

During the 10-year period from 1945 to 1955, the percentage of mentally retarded clients who were rehabilitated was one percent or less of the total rehabilitated population. However, the percent of rehabilitated clients who are mentally retarded has risen steadily over the years. From three percent in 1960, it rose to six percent in 1964 and to nine percent in 1966; since 1967, the number of rehabilitated mentally retarded has been greater than 10 percent of the total rehabilitated (Figure A and Table 74).

Approximately 2,000 or eight percent, of the total 26,762 mentally retarded clients rehabilitated during 1969 resided in Texas. Pennsylvania, with 1,444 mentally retarded clients, New York, with 1,381, and North Carolina, with 1,235, each account for approximately five percent of all rehabilitated mentally retarded. All the States have shown a substantial increase in the number of mentally retarded clients who have been rehabilitated since 1946 (Table 75).

There has been a steady increase among most of the States in the percentage of mentally retarded persons rehabilitated through State vocational rehabilitation agencies. Several States in 1969 indicated that approximately 20 percent of their rehabilitated clients were mentally retarded. As a comparison, of the total clients rehabilitated in 1959, only two States (Iowa and New Jersey) reported that more than seven percent were mentally retarded clients (Table 76).

Table 77 shows selected characteristics of mentally retarded clients and all other clients who were rehabilitated during 1969. The rehabilitation rate was slightly higher for the mentally retarded - 78.9 percent as compared with 75.4 percent for all other disabled clients. On the average, the mentally retarded clients were male, white, and considerably younger than all other rehabilitated clients. Also, almost all of the retarded clients were never married. Their primary source of support is usually contributions from family and friends. Only 11 percent were wage or salaried workers, but the rehabilitation rate is highest for this particular group. Mentally retarded clients remained in referral and applicant status longer than other types of clients. More than half of the mentally retarded have received training as a type of service, contrasted with 34 percent of all other clients. Slightly more than half were referred for rehabilitation by educational institutions.

## CHAPTER 13

### MENTALLY RETARDED RECIPIENTS OF PUBLIC ASSISTANCE

The primary responsibility of the Assistance Payments Administration is to insure that eligible needy persons receive money payments through the Federal-State public assistance programs of Aid to Families with Dependent Children (AFDC), Aid to the Blind (AB), Aid to the Permanently and Totally Disabled (APTD), and Old-age Assistance (OAA), under the Social Security Act as amended. Financial assistance is available to needy individuals who may also be mentally retarded under each of these programs. This assistance is through State-administered or State-supervised public welfare programs.

On the basis of study data, almost one-fifth (19 percent) of the child recipients of AFDC have had the psychological testing necessary to determine on a sound professional basis whether, by any specific definitions of retardation, they are mentally retarded. Also, in many instances the caseworkers have information, based on personal observation or on reports from relatives or acquaintances of the child, regarding mental retardation. In the recipient survey conducted in late 1967, caseworkers were asked to indicate for each child whether, based on professional opinion or otherwise, there was mental retardation. The reports were as follows:<sup>1/</sup>

Four percent of the children were reported as mentally retarded (two percent on the basis of professional opinion and two percent based on workers' observations, mothers' statements and similar sources).

82 percent of the children were reported as not retarded (17 percent on the basis of professional opinion and 65 percent from other sources).

For 15 percent of all child recipients it was unknown whether the child was mentally retarded.

The estimated number of children mentally retarded, whether based on professional or other opinion, represented five percent of all children other than those for whom the item was reported as unknown.

This estimate, that approximately five percent of AFDC recipient children are mentally retarded, may be low for two reasons. First, retardation among pre-schoolers is generally understated because mental retardation frequently does not come to light until after the child starts school. About one-third of all AFDC children are under six. Second, the bulk of the findings were based on observations by persons (mothers, caseworkers) who would ordinarily hesitate to ascribe mental retardation to a child unless rather definite evidence so indicated. Thus, "false negatives" are more likely to be reported than "false positives."

A survey of adult public recipients, including recipients of APTD, was conducted in 1970 by the National Center for Social Statistics. Preliminary data from this survey are presented in Table 78. In this survey, States reported for all recipients in the sample the diagnosis of the major impairment that supported a finding of permanent and total disability and the diagnosis of the impairment (if any) that was secondary in importance in contributing to a finding of permanent and total disability. Of the APTD recipients, 16 percent had mental retardation as their primary diagnosis, while about three percent had it as their secondary diagnosis. It is possible that some mentally retarded recipients may have had a primary or secondary impairment other than mental retardation supporting a finding of permanent and total disability.
